

To set up your React Native Development Environment, please follow the following instructions:

1. Go to <https://facebook.github.io/react-native/docs/getting-started.html> and select the development OS according to your host OS, and select the Target OS as Android:

# Getting Started

EDIT

This page will help you install and build your first React Native app. If you already have React Native installed, you can skip ahead to the [Tutorial](#).

Quick StartBuilding Projects with Native Code

Follow these instructions if you need to build native code in your project. For example, if you are integrating React Native into an existing application, or if you "ejected" from [Create React Native App](#), you'll need this section.

The instructions are a bit different depending on your development operating system, and whether you want to start developing for iOS or Android. If you want to develop for both iOS and Android, that's fine - you just have to pick one to start with, since the setup is a bit different.

Development OS: macOS Windows Linux Target OS: iOS Android

2. Complete the **"Installing Dependencies"** and **"Preparing the Android Device"** sections.
3. Create your virtual devices, and you are now ready to run applications over your emulator.
